

CREATOR OS + MARKETPLACE

Full Developer Build Plan

Single SaaS launch scope: build, sell, operate, and discover creator businesses in one platform

CORE PRODUCT

A multi-tenant SaaS where creators, experts, coaches, educators, and agencies can build a no-code website, storefront, digital products, courses, memberships, communities, and AI-powered web apps. They can monetize everything, publish it, run the business with AI agents, and sell through a built-in marketplace.

1. Product Goal

- A creator can go from an idea or audience to a live business without writing code.
- The platform must combine no-code creation, commerce, hosting, AI, analytics, marketing, and marketplace distribution.
- This is one connected SaaS product. Do not build separate disconnected tools.
- The marketplace launches with the product, not as a future add-on.

2. Main User Types

User	Purpose
Creator / Expert	Build website, products, courses, apps, memberships, community, and sell them.
Consumer / Buyer	Discover, purchase, subscribe to, and use creator products and apps.
Agency / Team	Manage multiple creators or client businesses with team roles and white-label options.
Platform Admin	Manage creators, apps, marketplace listings, payments, moderation, disputes, usage, and platform health.

3. Creation System

No-Code Website and Storefront Builder

- Drag-and-drop or block-based website builder with AI-assisted generation.
- Home page, landing pages, sales pages, about page, blog, product pages, link-in-bio page, and custom pages.
- Themes, reusable sections, responsive mobile layouts, brand colors, fonts, images, SEO settings, and custom domain support.
- Every creator gets a hosted storefront and can also connect their own domain.
- Pages must support forms, email capture, checkout blocks, testimonials, pricing tables, FAQs, embeds, and analytics.

AI App Builder

- Creator describes an app in natural language and the platform generates a working web app.
- Support accounts, dashboards, databases, forms, calculators, trackers, quizzes, directories, AI tools, subscriptions, memberships, notifications, and admin views.
- Conversational editing such as: add annual billing, change onboarding, create a referral system, add a streak, change layout, or add a new feature.
- Use a hybrid architecture: reliable reusable components for common features plus sandboxed custom code when necessary.

- Include app versioning, preview, publish, rollback, usage metering, logs, and error reporting.

Audience-to-Business Intelligence

- Creator can provide niche, content links, uploads, audience questions, comments, survey data, or existing products.
- AI identifies repeated pain points, high-interest topics, monetizable opportunities, and recommended products or apps.
- Return 3 to 5 launch ideas with target customer, feature set, monetization model, and suggested pricing.
- Creator can select an idea and send it directly into the app, website, or product builder.

4. Commerce and Creator Business Tools

- Sell digital downloads, templates, ebooks, courses, coaching, memberships, communities, paid apps, and subscriptions.
- Support one-time payments, recurring subscriptions, trials, freemium, payment plans, coupons, bundles, upsells, and usage credits.
- Stripe Connect or equivalent for creator payouts and platform fees.
- Creator CRM with leads, customers, subscribers, purchase history, segments, refunds, and customer status.
- Course builder with modules, lessons, video, downloads, quizzes, progress, gated access, and completion tracking.
- Membership and community areas with gated content, member profiles, posts, comments, announcements, and access rules.
- Coaching booking with availability, paid sessions, packages, calendar connection, reminders, and client notes.
- Affiliate and referral systems with unique links, attribution, commission rules, payouts, and performance tracking.

5. Marketplace

- Marketplace must launch with the SaaS and include creator apps, courses, memberships, digital products, and selected services.
- Categories, search, filters, featured products, trending products, rankings, creator profiles, reviews, ratings, and recommendations.
- Separate economics for creator-owned traffic versus marketplace-originated sales.
- Marketplace listing approval, moderation, fraud controls, refund rules, reporting, and prohibited-content controls.
- Track source attribution so the platform knows whether a sale came from the creator, an affiliate, or the marketplace.
- Creators should be able to publish or unpublish marketplace listings without changing the availability on their own storefront.

Remix and Template Marketplace

- Creators can optionally publish apps, websites, product structures, or workflows as remixable templates.
- Another creator can clone a template and customize it with AI.
- Track template ownership, license terms, platform commission, and optional original-creator royalty.
- Do not allow unauthorized cloning of private or non-remixable products.

6. AI Workforce

- AI CEO: summarizes business health, priorities, risks, and recommended actions.
- Growth Agent: identifies growth opportunities, campaigns, partnerships, and acquisition ideas.
- Content Agent: produces content ideas, scripts, posts, launch campaigns, SEO content, and promotional assets.
- Email Agent: creates onboarding, lifecycle, abandoned checkout, upsell, win-back, and newsletter campaigns.
- Support Agent: answers customer questions using the creator business knowledge base.
- Product Agent: reviews feedback and usage data, then recommends product and app improvements.
- Analytics Agent: explains revenue, conversion, retention, churn, and product performance in plain language.
- Affiliate Agent: helps recruit and manage affiliates and creator partnerships.
- Agents should share context and route tasks to each other. Actions that affect money, publishing, customer communication, or live app behavior must have permission controls and audit logs.

7. Growth, CRM, Email, and Analytics

- Email capture, broadcasts, automated sequences, segmentation, transactional messages, and campaign analytics.
- Content generation for TikTok, Reels, Shorts, YouTube, LinkedIn, X, newsletters, blogs, and launch campaigns.

- Analytics dashboard: revenue, MRR, ARR, GMV, sales, conversion, traffic, subscriptions, churn, LTV, refunds, trial conversion, product performance, marketplace performance, and affiliate performance.
- AI revenue optimization should identify issues and recommend pricing, onboarding, upsell, retention, and conversion improvements.
- Support controlled A/B tests for pages, pricing, checkout, and onboarding. Creator must be able to approve, pause, and review tests.

8. Publishing and Hosting

- Hosted websites and web apps with platform subdomains and custom domains.
- Automatic SSL, CDN, deployments, version history, backups, rollback, and environment isolation.
- Creator-owned assets and data must be scoped by tenant and protected by strict permissions.
- Support web apps and PWA installation. Also include a workflow for packaging eligible apps for iOS and Android, generating store assets and submission information. Apple and Google approval remains external to the platform.
- Provide logs, performance monitoring, error monitoring, rate limits, and abuse controls.

9. SaaS Account, Team, and Agency Features

- Creator onboarding, workspace creation, subscription plan, billing, usage, and account settings.
- Multiple businesses/apps under one creator account.
- Team roles and permissions for owner, admin, editor, support, finance, and analyst.
- Agency dashboard for managing multiple client workspaces.
- White-label options for eligible agency plans, including branding, custom domains, and client access.
- Central admin dashboard for users, workspaces, apps, listings, GMV, platform revenue, disputes, refunds, AI usage, storage, and system health.

10. Billing and Cost Controls

- Support monthly SaaS plans plus usage billing and transaction fees.
- Meter AI generation, AI end-user usage, storage, email, traffic, and high-cost compute so growth does not create unbounded platform costs.
- Do not offer unlimited expensive AI. Use credits, fair-use limits, model routing, caching, and creator-paid usage where needed.
- Keep creator infrastructure multi-tenant by default. Do not create a dedicated database or server for every small app.
- Track creator GMV and marketplace GMV separately. Marketplace-originated sales can have a higher commission because the platform supplies distribution.

11. Suggested Technical Shape

- Multi-tenant SaaS architecture with tenant-scoped authentication, data, files, billing, and permissions.
- Component/block system shared by website builder, storefront, and common app functionality.
- Sandboxed code-generation environment for custom functionality with security scanning and runtime limits.
- Shared managed database layer with tenant isolation. Dedicated infrastructure only for large customers when justified.
- Queue/background jobs for generation, publishing, email, analytics processing, AI agents, and marketplace indexing.
- Central billing and usage service for subscriptions, credits, transaction fees, marketplace commissions, affiliate attribution, and payouts.
- Central event/analytics layer so all modules can use the same customer, product, revenue, and behavior data.
- Audit log for AI actions, publishing, permissions, payouts, refunds, and other sensitive operations.

12. Required Integrations

- Payments and payouts: Stripe Connect or equivalent.
- Email: transactional and marketing provider with domain verification.

- Domains and DNS: custom-domain onboarding and SSL automation.
- AI: model routing layer that supports multiple model providers where useful.
- Storage/CDN: creator uploads, product files, media, app assets, and backups.
- Calendar: Google and other providers for coaching and scheduling.
- Social/content import: supported APIs where available, plus link/file import fallbacks.
- Observability: logs, errors, traces, performance, and cost monitoring.

13. Full User Flow

1. User signs up and creates a creator or agency workspace.
2. User chooses to build from an idea, analyze an audience, use a template, or start from a blank website/app.
3. AI or no-code builder creates the website, storefront, product, course, membership, or app.
4. User customizes branding, content, features, pricing, access rules, and domain.
5. User connects payments and configures customer billing or free access.
6. User publishes to their storefront and optionally lists the product or app in the marketplace.
7. Customers discover, purchase, subscribe, and use the product through the creator site or marketplace.
8. CRM, analytics, affiliates, email, and AI workforce begin operating from the same data layer.
9. Creator can update, optimize, remix, publish new versions, manage customers, and launch additional businesses from the same dashboard.

14. Definition of Done

- A non-technical creator can build and publish a professional website without code.
- A non-technical creator can generate and publish a functional paid web app from a prompt.
- Creators can sell courses, digital products, memberships, coaching, and apps from one storefront.
- Customers can browse and buy through the marketplace.
- Payments, subscriptions, platform fees, marketplace fees, payouts, refunds, affiliates, and usage credits work correctly.
- Creators can see customers, revenue, analytics, marketplace performance, and AI usage in one dashboard.
- AI agents can assist with content, email, support, product, growth, analytics, affiliates, and business recommendations with permissions and audit history.
- Creators can use custom domains, teams can collaborate, and agencies can manage multiple clients.
- The system has tenant isolation, moderation, backups, monitoring, rate limits, cost controls, and rollback capability.
- The product feels like one Creator Business OS, not separate modules bolted together.

15. Developer Note

The entire scope above is intended for the same product launch. You may choose the internal implementation order that minimizes rework and integration risk, but do not treat the website builder, marketplace, app builder, commerce, or AI workforce as optional future products. Build around shared authentication, billing, data, analytics, and permissions from the beginning.
